Field The present invention relates to a magnetically-excited type of stepping motor, a camera module and a method for assembling a magnetically-excited type of stepping motor. Related Art Stepping motors are motors that rotate along a predetermined direction with a given speed, and are widely used for purposes including, for example, recording of information into a memory card. A magnetically-excited type of stepping motor is provided with a rotor magnet that generates a magnetic field in response to a current supplied to an excitation coil. Therefore, the magnetically-excited type of stepping motor does not require a commutator as compared to the other types of stepping motors, and can be small in size and can be used for a long time. In recent years, with the advancement of high-pixel imaging devices, higher resolution of cameras is in demand. Therefore, the magnetically-excited type of stepping motor, which is small in size, can be used in the above application field. In order to realize a camera module with a higher resolution, there is a need for a stepping motor with a high accuracy. For example, the accuracy of the center of gravity in the stepping motor should be high, as well as the accuracy of the mechanical accuracy of the shaft of the stepping motor. In the related art, a magnetically-excited type of stepping motor includes, for example, an excitation coil wound around a bobbin, and a yoke portion serving as a magnet interposed between the bobbin and a shaft. An upper surface and a lower surface of the bobbin and a portion of the yoke portion are brazed in order to prevent positional deviation from being caused between a lower end surface of the yoke portion and a shaft portion of the shaft.
