---

a retaining device that is comprised of a clamp and a bus bar clamping element which are disposed on the opposite sides of the bus bar in facing relation to each other. The clamping element includes a flange arm having a sleeve-like member which surrounds the bus bar and is clamped around it by the two arms. The flange arm also has an aperture through which the sleeve-like member extends for receiving fastening screws which are employed to secure the flange arm to a printed circuit board and to secure the bus bar and the flange arm together. In addition, each flange arm has a first thread extending from an end surface of the flange arm and a second thread which extends from an end surface of the sleeve-like member into and through the first thread.

2. Description of Related Art A bus bar is a metal piece that is disposed in a bus bar connecting box which is used to connect several electrical components in an electrical system together. Generally, the bus bar is disposed on a printed circuit board and is retained in place on the printed circuit board by a retaining member. The bus bar connecting box is primarily employed to connect several switches to a power source, to connect several power sources to other switches, and to connect the switches to the input and output sides of a control system which directs the flow of electricity through the electrical system. The retaining member provides retention of the bus bar to the printed circuit board. Because the bus bar connecting box is secured to the printed circuit board, and because the bus bar is connected to the printed circuit board, any vibration or shock which is imparted to the bus bar connecting box could be transmitted through the bus bar to the printed circuit board. Such a transmitted shock or vibration could ultimately cause the printed circuit board to fail, particularly when the printed circuit board includes a digital integrated circuit, for example, such as a microprocessor, a microcontroller, or a microprocessor-based controller. Accordingly, it would be

---

desirable to provide a retaining device which would attach the bus bar to the printed circuit board so that the bus bar would not move in relation
