### AutoCAD

Learning A model of the language's basic concepts, and how they are implemented in the parser is called a grammar. More specifically, the grammar of a programming language is a set of rules for converting strings of text into elements of the language. A "string" is a sequence of characters. For example, "ABC" is a string of three characters. A "parser" is a program that "reads" a string and converts it into a representation that is easily readable by the program, such as an object or number. For example, if "ABC" is read by a parser, it might find that it can replace the "A" with an object called Letter, which has a "type" of "A", and then replace the "B" with the object called Letter. The parser can store the letters in memory and then read them back out at a later time. A "compiler" is the opposite of a parser: it reads the code and converts it into a machine-readable format. A "runtime" is the program that is invoked once the code is compiled. A set of grammar rules is called a grammar (or simply, a "grammar"). A grammar contains a set of productions. A production is one of the following: a binary operator, such as "\*" or "+" a list of several character literals, which may include "''", or a sequence of two character literals a list of some other production, such as an "operand" production a production called a "terminal" production, which is a literal character or any one of a list of characters a production called a "nonterminal" production, which is either a "terminal" production or a sequence of a number of "terminal" productions, followed by the production called a "over" or "reduce" production, and optionally followed by one of the productions called a "rewind" production. This production defines the reduction of the stack (also called the "reduction stack" or "reduction environment"). A reduce production is a production that does not consume input, such as a list of several character literals or a binary operator. An "operand" production is one of the following: a single letter a two-character sequence a three-character sequence a two-letter sequence a character literal a binary operator A "character literal ca3bfb1094
