Download Evangelion 3.33 torrent for free, Anime, Anime, Movie, 3.33A variety of compositions for removing metallic and nonmetallic contaminant substances from contaminated liquids have been developed for many years. Such compositions are particularly useful in removing toxic organic substances, such as pesticides, herbicides, and insecticides, from water in which the pesticides have been applied or in treating the water to remove certain contaminants, such as heavy metals or minerals. A particularly effective class of compositions for removing such contaminants from water is referred to as chelating agents. Generally, a chelating agent is a compound containing multiple metal chelating groups which are present in such a form so as to be able to chelate metal ions. The chelating group is generally a multidentate ligand containing the elements carbon, nitrogen, and oxygen. The ligand preferably contains a plurality of acidic groups, such as carboxylic acid, amine, sulfonic acid, and the like, capable of chelating a variety of metals. One such chelating agent, for example, is ethylenediaminetetraacetic acid (EDTA). Chelating agents can be used to remove nonmetallic contaminants such as organic compounds which can also form weak complexes with metals. A primary example of this class of contaminant is nonionic organic materials such as phosphates. An example of a particularly effective contaminant removing composition which employs chelating agents is disclosed in U.S. Pat. No. 3,963,657 to Lorz. In accordance with this patent, the contaminant removing composition comprises a dispersant, an anionic surfactant and a neutralizing agent selected from the group consisting of phosphoric acid, boric acid, and polyacrylic acid. The dispersant includes an organic surface active material and an amine having an isoelectric point greater than 4.5. Other contaminant removing compositions which employ chelating agents are disclosed in U.S. Pat. No. 4,018,788 to Galassi et al., U.S. Pat. No. 4,104,252 to Cleland, U.S. Pat. No. 4,260,554 to Lorz, U.S. Pat. No. 4,368,128 to Calandra, and U.S. Pat. No. 4,369,134 to Calandra. Of particular interest are contaminant removing compositions which are designed for a specific
