Adobe Photoshop is a bit like Microsoft Windows. It is easy to install and use, but if you crack it, you can make it behave like any other application. You can't tell if it is cracked or not unless you have a cracked version of it. If you want to know if your Photoshop is cracked, open the file, go to the Help menu and check the version number. If it says 3.0, then it is not cracked. If it says 3.0.0, then it is cracked. Adobe Photoshop is a bit like Microsoft Windows in that it has security measures built in. Basically, the idea is to protect you from viruses and unwanted software that may attack your operating system. If you crack Adobe Photoshop, then you can override the security and allow the virus to attack your computer. If you forget to crack it, then you don't have that option. Use the crack responsibly. If you don't know how to crack it, then be sure to use the software responsibly. Also, don't use the cracked version for any other purpose other than test driving it. Cracks can cause system damage, so use it wisely.

There are two ways to open a file for editing. The first is to double-click on a file and have it open in Photoshop. This will place a "File Open" window in Photoshop related to the file. Files opened in this manner will appear in the main Photoshop window and be treated as a normal image (with the exception of being sized and formatted). They will automatically be saved as a flattened PSD file. While opens from the Finder are not processed in this manner, they will be opened in the Photoshop window for editing. The other method is to drag a file onto Photoshop from the Finder. Navigating is easy. There isn't a dedicated file menu where you can open all the recently added files. There are a few options. One is through a split window from the History panel. You can navigate to the folder you want to create a new file from, and then select the file from the folder. That will bring up the file and open it for editing. There are some really nice features. My favorite is the ability to hold shift and press the command key at the same time to duplicate the last selected layer. This tool is a bit faster and is much easier to use than the "duplicate" command in Photoshop. Paste to clipboard and Paste as Path are great tools. I've noticed editing without a problem even on my MacBook Air with 32 GB of RAM. It's not difficult or time consuming. You simply download the.psd file for Lightroom 5, then open it with Photoshop and drag it right over your previous Lightroom file. It's a simple form of mirroring editing across the two applications.
